

TAKE THIS SHORT WATER LINE SERVICE MATERIAL SURVEY

TO HELP US PROTECT YOUR DRINKING WATER

Under EPA regulations called the Lead & Copper Rule, all water providers (like the City) are required to catalog the materials used in all water service lines — these are the pipes that deliver water from the City's main water supply directly to your property.

The goal is to ensure that lead and copper levels in your entire water supply — from the Water Treatment Plant to your faucet — are controlled and within safe limits; we're happy to share that our Water Department has completed the City-owned service line material inventory!

The job isn't over though. We need your help to inventory the portions that run into your homes and businesses. Please help us build our records by completing a survey about your property's water service lines.
